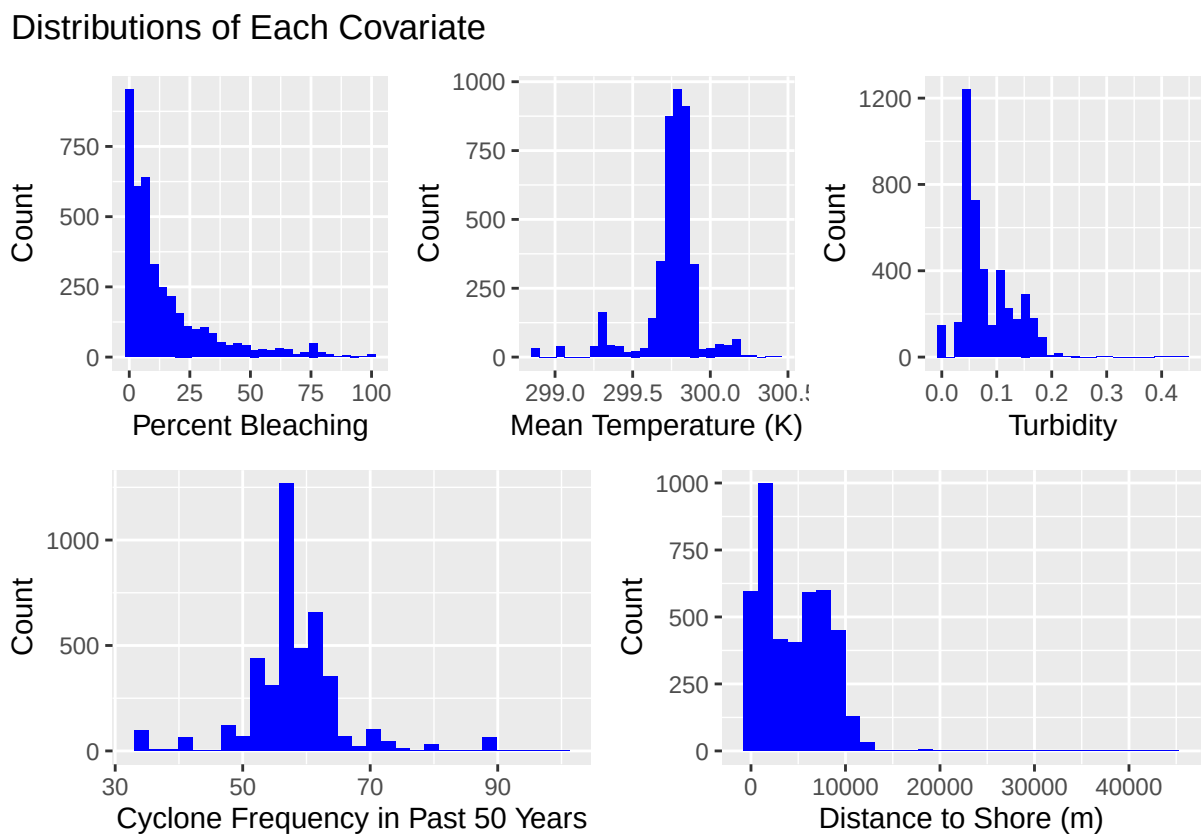
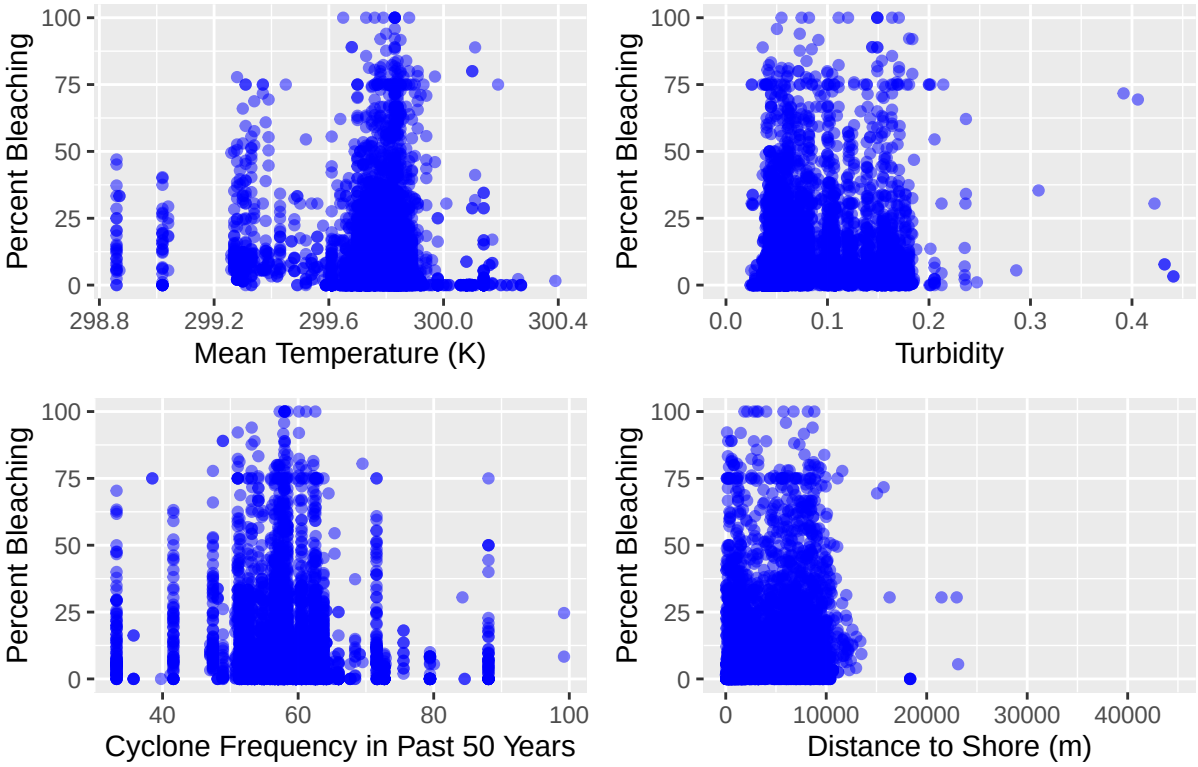
Notes from Clay

percent data: look into GLM family that people use. probably not binomial. gaussian?

Add spatial component. could be used to add categorical variable

```r
# Histograms
histograms <- (hist_bleaching + hist_temp + hist_turbidity) / (hist_cyclone + hist_dist_to_shore) +
  plot_annotation(
  title = "Distributions of Each Covariate")
histograms
```



```r
# Scatters
scatterplots <- (scatter_temp + scatter_turbidity) / (scatter_cyclone + scatter_distance_to_shore) +
  plot_annotation(
    title = "Relationship Between Covariates and Percent Bleaching")
scatterplots
```


Relationship Between Covariates and Percent Bleaching
